RAF and Children: Serious Injury Isn't Always Obvious

Dear Legal Partner

Did you know that developmental trauma in children often lacks visible severity in the acute phase, yet may carry devastating long-term sequelae?

Paediatric Medico-Legal Claims – Build Stronger Narratives

Orthopaedic Injuries in Growth Plates:

Fractures affecting the physis can cause future limb length discrepancy, joint deformity, or early osteoarthritis – often missed if not explicitly assessed.

Traumatic Brain Injury (TBI):

Even minor TBIs can manifest as poor concentration, aggression, or scholastic underperformance years later. Paediatric neuropsychological assessments are crucial for such cases.

Educational Prognosis = Economic Loss:

Delayed milestones, remedial schooling, and lower future earning capacity must be clearly quantified to meet the RAF's burden of proof.

MedSol offers expert-led paediatric panels combining neurosurgical, orthopaedic, psychological, and functional capacity evaluations.

Let us help you secure the full scope of damages your young clients are entitled to.
